

# MINI POWER PLANT

## THE CONCEPT

Pressure reduction in industrial steam systems is a general demand. For saturated steam systems up to 20 bar we offer you a mini power plant. This system converts a certain part of the heat energy into electrical energy in a cost effective way. The generated electrical energy can be fed to the low voltage mains. If used adequately the return time on investment lies between 2 - 4 years, depending on the price of electrical energy in the region.
